

Content Quality & E-E-A-T Audit

Mango homepage — localhost:3000/ (canonical mangoaiusa.com)

Generated 27 August 2026 · claude-seo seo-content · Analysed against rendered server HTML

55/100

CONTENT QUALITY

68/100

AI CITATION READINESS

3,088

WORDS ON PAGE

Scores are this skill's own heuristics, not Google-internal signals. Use them to prioritise, not as absolute grades.

Snapshot

METRIC	VALUE	VERDICT
Word count	3,088	Well above the 500-word homepage coverage floor
Avg sentence length	16.7 words	Inside the 15–20 target band
Heading structure	1×H1, 12×H2, 29×H3	Clean H1→H2→H3, no skipped levels
Internal links	53 (21 unique)	Strong, descriptive anchors; all resolve
External links	14 (7 unique)	Integration vendors only — no authority citations
Structured data	4 JSON-LD blocks	Organization, WebSite, SoftwareApplication, FAQPage — all parse clean
Images	2 (both logo)	All other visuals are DOM/CSS-rendered

E-E-A-T Breakdown

FACTOR	SCORE	KEY SIGNALS
Experience	9 / 20	Excellent scenario specificity (burst pipe at 10pm, water-heater triage), but no verifiable first-hand artifact. The “Real call — Tap to play” player is a mockup, not a recording.
Expertise	17 / 25	Genuine trade fluency: emergency triage, dispatch matching, and an accurate four-way alternatives framing. No named author, founder, or team credential on-page.
Authoritativeness	10 / 25	No third-party validation. Logo strip is fictional brands; no press, no external citations.
Trustworthiness	19 / 30	Genuinely strong disclosure work, undercut by one section (see Issue 1).

Weights follow Google’s stated hierarchy — Trust weighted highest (30), Expertise and Authoritativeness next (25 each), Experience (20). Google publishes no numeric weights; this split is the skill’s internal model.

Issues Found

1. Fabricated attributed testimonials **CRITICAL**

components/sections/Testimonials.tsx:38–53, :64

Three named individuals with roles, companies, five-star ratings and hard metrics (`+41% weekend revenue` , `6 hrs/day saved` , `0 missed calls`) are hardcoded placeholders. The same fictional companies — AquaPlumb, AirPro HVAC, VoltElectric — also populate the logo strip.

The aggravating factor is the section description, which actively asserts provenance:

"Figures beside each quote are what that operator reported to us."

This is the exact inverse of the standard already set in `Metrics.tsx:83` and the Comparison footnote, where unsourced figures are correctly labelled as illustrations. Testimonials is the one section claiming a source it does not have.

Mitigating: no `Review` or `aggregateRating` schema is emitted, so this is an on-page trust problem, not a structured-data policy violation.

2. Missing `og:image` sitewide **HIGH**

app/layout.tsx:37–51

`twitter:card` is set to `summary_large_image` , but neither `openGraph.images` nor `twitter.images` is defined, and no `opengraph-image` file exists in `app/` . Every social share of every page renders as a bare text card. Cheapest high-value fix on this list.

3. Unsourced volume claim **HIGH**

components/sections/FinalCTA.tsx:44

"Join hundreds of home service teams..."

Same category as Issue 1, and inconsistent with the disclosure standard the rest of the page holds itself to.

4. Price display inconsistency **MEDIUM**

components/sections/Pricing.tsx:16

`annual` defaults to `true` , so pricing cards render Starter at **\$79/mo**. Metrics, the ROI calculator, the comparison table and `SoftwareApplication` schema all quote **\$99**. Both are correct (\$99 monthly / \$79 annual), but a scanning visitor meets the contradiction three times before reaching the cards.

5. Contact domain mismatch MEDIUM

app/layout.tsx (Organization schema) · components/layout/Footer.tsx

Organization schema and the footer both list `info@imeraai.com` on `mangoaiusa.com`. There is no physical address and no phone number. For a product whose entire pitch is answering the phone, having no reachable number is a conspicuous trust gap.

6. No authorship or organisational provenance MEDIUM

No founder, team or credential surface on the homepage, and no `Person` schema anywhere on the site. This fails the “Who” leg of Google’s Who / How / Why helpful-content test.

Recommendations

Do first

1. **Rewrite the testimonials section description.** Drop “what that operator reported to us.” Until real customers are quotable, either label the section illustrative (matching the Metrics precedent) or replace the quotes with capability statements that need no attribution.
2. **Add an OG image.** Drop `app/opengraph-image.png` at 1200×630 — the Next.js file convention wires it automatically, no metadata edit required.
3. **Cut or substantiate** “hundreds of home service teams.”

Do next

4. **Default the pricing toggle to Monthly** so the \$99 shown everywhere else matches the cards. Cheaper than editing four other sections.
5. **Add a real phone number** and a `mangoaiusa.com` email to the footer and the `ContactPoint` schema.
6. **Add an author / leadership surface** — a founder note or team block on `/about`, plus `Person` schema — to answer “Who.”

Strengthens AI citation

7. **Publish one real artifact of experience:** an anonymised call transcript, a redacted dashboard screenshot, or a single customer result you can stand behind. This is the one gap no copy change can close.

What's already working

Worth preserving while editing — this page does several things most SaaS homepages get wrong:

- The **Metrics disclaimer** and **Comparison footnote** name the basis of every number and label the sets as illustrative.
- The **integrations FAQ** explicitly says two-way sync “is still in build” rather than implying it ships today.
- **No fabricated** `aggregateRating` in structured data.
- The **comparison table** is the most AI-citable asset on the page — structured, hedged, with a *failure mode* column competitors do not publish.
- **Internal linking is genuinely good:** 21 unique targets, descriptive anchors, no orphans, no broken links. `/customers` 308s intentionally to `/#testimonials`.

Method: analysis run against the server-rendered HTML of `http://localhost:3000/` (553 KB), with claims cross-checked against component source in the working tree. Word and sentence counts exclude `<script>` and `<style>` content. Per Google's guidance on third-party SEO tools, no external tool has access to Google's internal ranking data — Search Console remains the first-party source of truth.
